Sep 07, 2022 · electrostatics. Then integrating it over an "observation plane" above the NP chain as depicted in Fig. 1  $P_{tot} = \int dx dy \mathbf{S} \cdot \mathbf{e}_z$  (1) with the unit vector  $\mathbf{e}_z$  in z-direction. This quantity gives then the emitted power by thermal radiation of the NP in the far-field  $P_{tot} = P_{dir}$ . All the details of the calculation can be found in ...

Solutions to Problems in Jackson, *Classical Electrodynamics*, Third Edition Homer Reid December 8, 1999 Chapter 2 Problem 2.1 A point charge  $q$  is brought to a position a distance  $d$  away from an infinite plane conductor held at zero potential. Using the method of images, find: (a) the surface-charge density induced on the plane, and plot it;

with two or more quasiparticles over the closed shell vacuum. A vast variety of solutions for the problem were proposed in several decades, including the use of incomplete model spaces [67, 68], conversion of the amplitude equations into matrix eigenvalue problems (equation-of-motion (EOM)-like formulations, [60, 69–72]), construction
